

A whirlwind tour through the input development efforts

Peter Hutterer

XDC 2019, Montreal

Outline

doing it

did it

thinking

Outline

doing it

did it

thinking

high-resolution wheel scrolling

hardware

1 detent per 15 or 20°

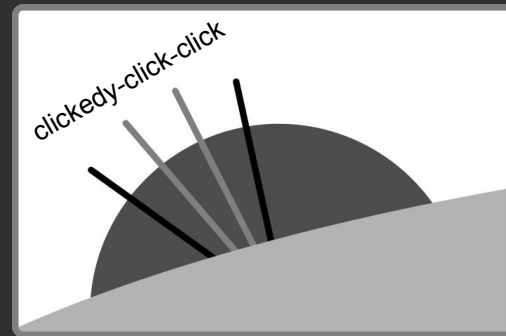

- value 1 per detent

hardware

hi-res mice have a "multiplier"

- multiplier per detent
 - 4 events with value 1
 - 1 event with value 4
 - 2 events with value 2

firmware

- **HID Resolution Multiplier**
- **Logitech HID++**

kernel 5.0

New axes using a 120 base:

REL_WHEEL_HI_RES
REL_HWHEEL_HI_RES

This is a separate event stream

```
REL_WHEEL_HI_RES 30
----- SYN_REPORT -----
REL_WHEEL_HI_RES 30
----- SYN_REPORT -----
REL_WHEEL_HI_RES 30
----- SYN_REPORT -----
REL_WHEEL_HI_RES 30
REL_WHEEL          1
----- SYN_REPORT -----
```

libinput

LIBINPUT_EVENT_POINTER_AXIS

- axis source (wheel, finger, ...)
- delta in degrees or pixels
- discrete steps

libinput

LIBINPUT_EVENT_POINTER_AXIS_WHEEL

- axis source == **wheel**
- delta in degrees
- discrete steps == **0**
- v120 value

This is a separate event stream

wayland

`wl_pointer.axis_source`

`wl_pointer.axis` (pixels)

`wl_pointer.axis_discrete`

`wl_pointer.frame`

We only have one `wl_pointer`

wayland

Issues:

- no-one likes discrete 0
- merged `wl_pointer`
- magic distance 10
- `wl_pointer.axis_source` needs `wl_pointer.axis`

wl_pointer.pointer_axis_v120

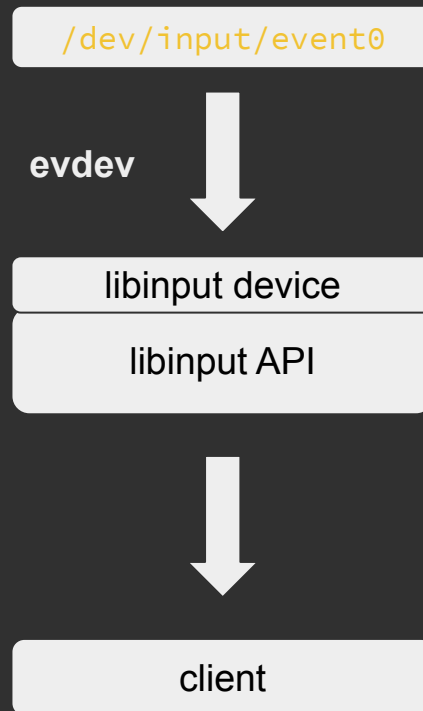

Needs to be a separate event stream

wayland

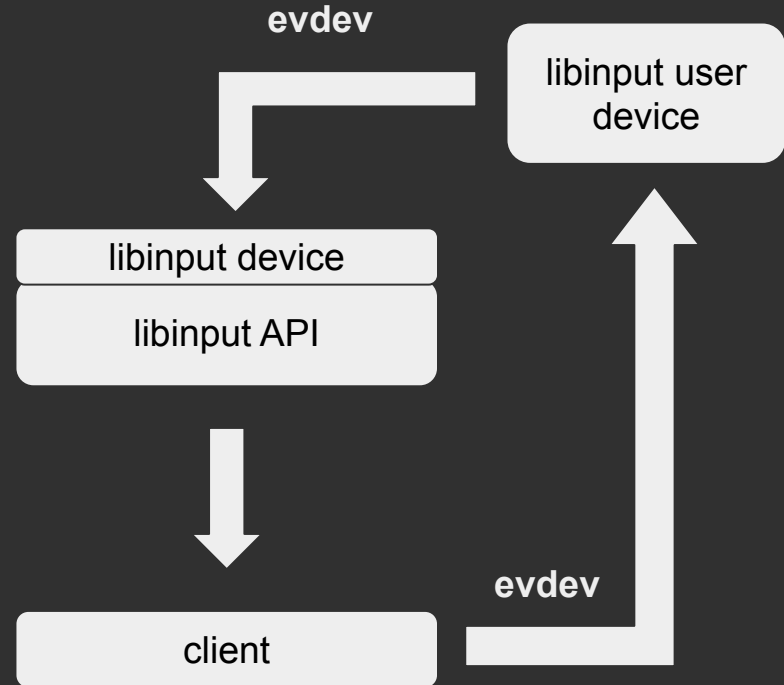

```
wl_pointer.axis_source    wheel
wl_pointer.axis_v120     40
wl_pointer.frame
wl_pointer.axis_source    wheel
wl_pointer.axis_v120     40
wl_pointer.frame
wl_pointer.axis_source    wheel
wl_pointer.axis_v120     40
wl_pointer.axis          10
wl_pointer.axis_discrete 1
wl_pointer.frame
```

libinput user devices

kernel devices

user devices

but why?

libinput test suite

- takes ~60min
- timeout-based failures
- needs root
- needs uinput
- needs udev
- messes with the session

user devices

- any fd will do
- no udev dependency
- potential gettime-fd

not in my lib!

Issues:

- udev leaks into the API
- quirks ... ???

`libinput-testing.so`

XKB user configuration

changing a single key is hard!

XKB

Required:

- a custom layout
- include directory shuffling

```
partial alphanumeric_keys
xkb_symbols "custom" {
    include "us(basic)"
    name[Group1]= "English (US)";
    key.type[group1]="ONE_LEVEL";

    key <TLDE> { [ VoidSymbol ] };
};
```

xmodmap

```
keycode 49 = NoSymbol
```

XKB pieces

RMLVO → KCGST

- rules: everyone uses "evdev"
- models: everyone uses "evdev"

evdev.xml for GUIs

rules files

```
! option      =      symbols
grp:shift_toggle = +group(shifts_toggle)
altwin:menu    = +altwin(menu)
altwin:meta_alt = +altwin(meta_alt)
altwin:alt_win = +altwin(alt_win)
altwin:ctrl_win = +altwin(ctrl_win)

! model       =      keycodes
pc98          =      evdev(pc98)
applealu_jis  =      evdev+macintosh(jisevdev)
$jollamodels =      evdev+jolla(jolla)
olpc          =      evdev+olpc(olpc)
olpcm        =      evdev+olpc(olpcm)
*            =      evdev
```

Not enough useful wildcards

user rules

- Default to `$HOME/.xkb/rules`
- Add `include` statement

```
! option      = symbols
  totally:awesome = +some(option)

! include %S/evdev
```

user rules

evdev.xml parsers

- libgnome-desktop
- Qt
- libxklavier

```
<xi:include href="...">
```

evdev.lst parsers:

- loginctl

ratbag-emu

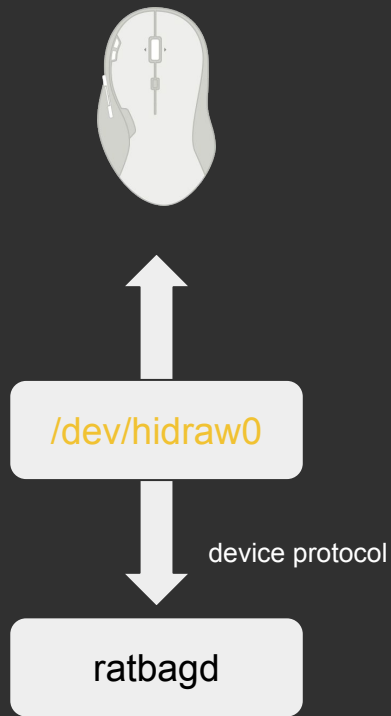

Filipe Laíns, Logitech

mouse firmware emulator

<https://github.com/libratbag/ratbag-emu>

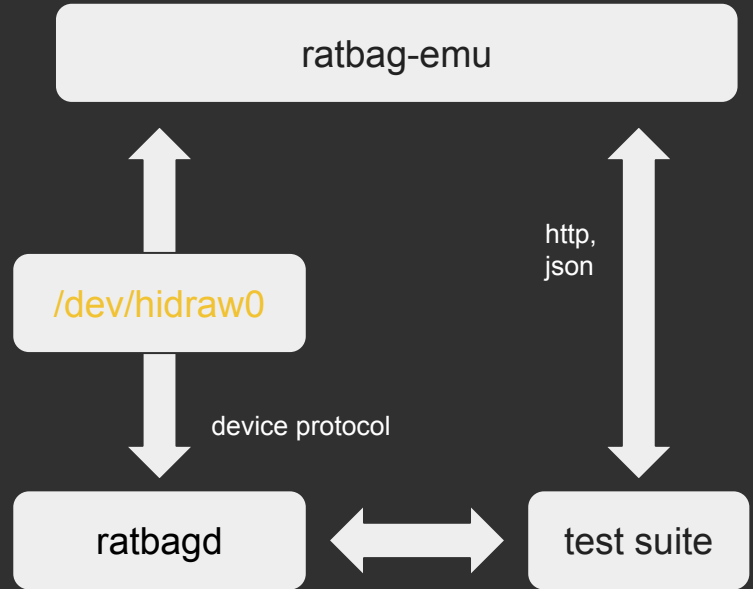

ratbag-emu

Filipe Laíns, Logitech

ratbag-emu

Outline

doing it

did it

thinking

Totem

dell.com

Totem

kernel 4.19

- `ABS_MT_TOOL MT_TOOL_DIAL`

libinput

- `LIBINPUT_TABLET_TOOL_TYPE_TOTEM`
- `libinput_event_tablet_tool_get_size_major`
- `libinput_event_tablet_tool_get_size_minor`

Wayland (proposed)

- `wl_tablet_tool.type`
- `wl_tablet_tool.size`

Totem

Applications:

- none
- ???
- yeah, right

Touch arbitration

Only on screen tablets atm

Tuhi

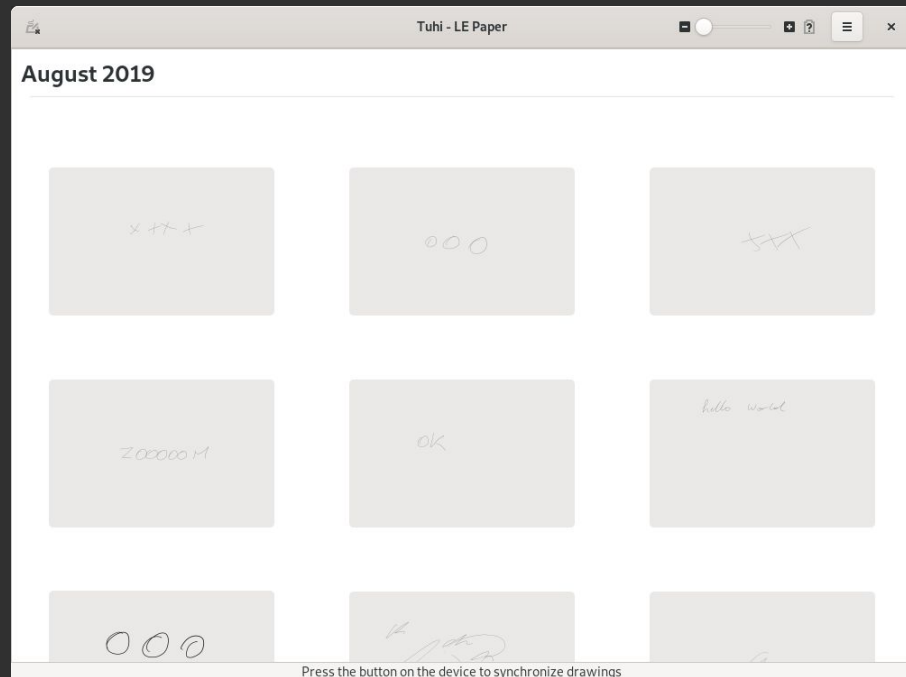

by Jakub Steiner

GTK application for Wacom
Smartpads

- Bamboo Spark
- Bamboo Folio
- Bamboo Slate
- Intuos Pro

<http://github.com/tuhiproject/tuhi>

Tuhi

xf86-input-evdev

- last commit May 2018
- 2.10.0 release 4 years ago
 - 19 commits since

xf86-input-synaptics

- 1.9.0 release Nov 2016
 - 9 commits since

The libinput party bus

- libinput 1.9.0..
 - ~1100 commits
 - ~980 by me
 - crickets tag: help needed
- gitlab a mixed blessing
 - much more efficient
 - CI is a blessing (-ish)
 - but zero reviews

libratbag

by Andy Fitzsimon

- ETIME/EINTR
- Still no stable Dbus API

libevdev

nothing to report

libevdev

python-libevdev

<https://readthedocs.org/projects/python-libevdev/>

libinput quirks

devices need "this is broken" tags

udev hwdb

- free key/value storage
- arbitrary lookup rules

udev hwdb

hwdb become unmaintainable

- too hard to debug
- `udevadm hwdb --update` vs `systemd-hwdb update`
- disconnected "configuration"

libinput quirks

```
[Logitech M570]
MatchName=*Logitech M570*
ModelTrackball=1

# Marble Mouse claims to have a middle button
[Logitech Marble Mouse Trackball]
MatchUdevType=mouse
MatchBus=usb
MatchVendor=0x46D
MatchProduct=0xC408
AttrEventCodeDisable=BTN_MIDDLE

[Logitech K400]
MatchUdevType=mouse
MatchBus=usb
MatchVendor=0x046D
MatchProduct=0x4024
ModelBouncingKeys=1
```

hid-generic rebinding

hid-generic unbinds when there's a
better driver available

libinput record

Replacement for **evemu**

- **YAML instead of custom format**

Debugging tool in the libinput git repo

Summary

- high resolution wheel scrolling
- libinput user devices
- XKB user configuration
- ratbag-emu firmware emulator
- Dell Canvas Totem
- Touch arbitration
- Tuhi for Wacom Smartpads
- xf86-input-evdev/synaptics in maintenance mode
- libinput's bus factor is bad
- libinput quirks/record/replay
- hold gestures
